Project: Project Management & Smart Project Allocation

1) Challenge Context

As part of the learning journey, students are required to work on projects that provide an opportunity to apply their knowledge and skills. Currently, the process of project submission, evaluation and allocation involves significant manual tracking.

Managing project submissions, evaluating projects and deciding which project should be assigned to which student can become difficult as the number of students and projects increases.

There is an opportunity to create a digital platform that can streamline project management and use AI to recommend suitable projects for students based on relevant student information.

2) Problem Statement

Tata STRIVE is seeking an intelligent digital solution to streamline the end-to-end management of student projects, from project submission and evaluation to project allocation.

The solution should use available student information, such as background, interests and assessment performance, to recommend suitable projects for individual students and reduce the manual effort involved in project allocation and tracking.

3) Solution that we are looking forward to:

- Manage project submissions: Provide a platform where projects can be submitted and their status can be tracked.
- Manage project evaluation: Enable projects to be evaluated and maintain the evaluation details in one place.
- Capture student information: Capture relevant information such as student background, areas of interest and assessment performance that can be used for project allocation.
- Recommend suitable projects: Use AI to analyse student information and recommend projects that are relevant to their interests, background and performance.
- Support project allocation: Help the programme team make project allocation decisions based on AI-generated recommendations.
- Track project progress: Provide visibility into project allocation, submission and evaluation status.
- Provide a consolidated view: Give programme teams a single platform to monitor students, projects, evaluations and allocation status.

The AI recommendation should support the programme team in making allocation decisions rather than completely replacing human decision-making.

4) Impact of the Solution:

For Students: Students would be assigned projects that are more relevant to their interests, background and demonstrated skills.

For Facilitators/Programme Teams: The solution would reduce manual effort involved in tracking submissions, evaluations and project allocation.

For Programme Management: The platform would provide better visibility into project status and enable a more structured and data-driven approach to project allocation.

For Tata STRIVE: The solution would help create a scalable and systematic project management process that can support a larger number of students and projects.

5) Key Considerations:

- The solution should provide a simple digital platform for project submission, evaluation and tracking.
- The AI-based project recommendation should be based on clearly defined student and project attributes.
- The solution should clearly show the factors considered when recommending a project to a student.
- The system should allow programme teams to review and modify AI-generated recommendations before final allocation and reduce manual effort in project allocation.
- For the hackathon, participants can use sample student profiles, assessment data, interests and project information to demonstrate the recommendation process.
